Over the last three years I've been at Gain Compliance ushering in new high performance technology while building out new features and providing production support. **I am ready for something new.** I love researching and learning, 3D computer vision, leveraging GPU acceleration, and automation at scale.

Notable Achievements

Alleviated critical memory constraints by leading data migration to a Neo4J backed GraphQL service, inviting engineers to learn and explore complex data, provided low latency and high availability of GraphQL requests, supported continuous delivery and deployment, mitigated production bugs, built and deployed development and production docker images.

Technical Skills

Previous Work

Used AWS's CloudFormation, Lambda and CloudWatch to deliver highly available platform using test driven development. Before that I optimized an existing remanufacturing web application through full-stack development and designed an RFID asset tracking to collect performance metrics. I also developed a fully automated reporting and analysis system that saved over 80 work days per year and discovered more than \$10M of unrealized revenue.
